Deja tu fedora a punto para el uso diario
Please note this is for the 32 bit installs

if you find this article useful, then I'd appreciate if you'd [digg it !](#)

as root (su -) install the current livna rpm to get access to livna's goodies

```
CODErpm -ivh http://rpm.livna.org/fedora/6/i386/livna-release-6-1.noarch.rpm
```

now let's add freshrpm's to that list

```
CODErpm -ivh  
http://ayo.freshrpms.net/fedora/linux/6/i386/RPMS.freshrpms/freshrpms-release-1.1-1.fc.noarch.  
rpm
```

ok, done. Now lets have some fun:-

1. let's install the **MP3 plugins** (currently gstreamer-plugins-mp3 is BAD so will error, but try again in a day or two)

```
CODEyum -y install xmms-mp3 gstreamer-plugins-mp3 libmad libid3tag
```

2. lets install the Flash plugin

use **vi** to create a new file

```
CODEvi /etc/yum.repos.d/flash.repo
```

now copy the text below and paste it into the new file (press I to INSERT text...)

```
QUOTE[macromedia]name=Macromedia for i386 Linux  
baseurl=http://macromedia.mplug.org/rpm/  
enabled=1  
gpgcheck=1  
gpgkey=http://macromedia.mplug.org/FEDORA-GPG-KEY
```

save the file with **:wq**

```
CODEyum -y install flash-plugin
```

3. Next up for multimedia action and DVD playing we will install **xine**

Fedora Core 6 a punto!

```
CODEyum -y install xine xine-lib xine-skins
```

4. A Fedora install would not be complete without the coolest video player **mplayer**, so let's install it

```
CODEyum -y --disablerepo=livna install mplayer mplayer-skins mplayer-fonts
```

and now we'll install the **windows codecs** for mplayer

```
CODEwget http://www1.mplayerhq.hu/MPlayer/releases/codecs/essential-20061022.tar.bz2
gtar xjvf essential-20061022.tar.bz2
mkdir /usr/local/lib/win32
mv essential-20061022/* /usr/local/lib/win32
```

now we need to install the **mplayer plugin** for **web browsers**

```
CODEyum -y install mplayerplug-in
```

5. Install Java !

Download Java JDK 5.0 Update 8 (not 9 as it causes problems)

Get over to [Sun's Java download site](#) and choose the Linux RPM in [self-extracting file](#) version.

Linux RPM in self-extracting file [jdk-1_5_0_08-linux-i586-rpm.bin](#) 45.48 MB

Open a Terminal.
Become root:

```
CODEsu -
```

Change back to your home directory (instead of root's home directory):

```
CODEcd ~username
```

Where "username" is your normal username.

Run the file that you downloaded, by doing:

```
CODEsh Desktop/jdk-1_5_0_08-linux-i586-rpm.bin
```

Fedora Core 6 a punto!

It will display a license agreement. You can press q to skip it.
Type **"yes"** when it asks you if you agree. Then it will install Java.

Finally, you can enable the Java plugin for your web browser:

```
CODEIn -s /usr/java/jdk1.5.0_08/jre/plugin/i386/ns7/libjavaplugin_oji.so /usr/lib/mozilla/plugins/
```
